Supplementary Figure S1

A. MAL interacts effectively with skeletal muscle $\alpha$-Actin. Anti-Flag immunoprecipitates from lysates of cells transiently expressing Flag-skeletal muscle $\alpha$-Actin or Flag-cytoplasmic $\beta$-Actin with or without MAL-HA, or MAL-HA alone, were analysed by immunoblotting for MAL (HA) and Actin (Flag).

B. MAL is not detectable in Profilin immunoprecipitates. Anti-Flag immunoprecipitates from lysates of cells transiently expressing Flag-profilin and MAL-HA were analysed by immunoblotting for MAL (HA), Profilin (Flag) and endogenous Actin.
