Downregulation of 2c18 using siRNA oligonucleotides.

(A) - (E) HeLa cells were treated with siRNA oligonucleotides as described in Materials and Methods. (A) Protein extracts were from these cells were subjected to SDS-PAGE and Western blotting for 2c18 and α-tubulin. Oligonucleotides against 2c18 mRNA reduced the levels of 2c18 protein by greater than 80% compared to controls. (B) - (E) Cells were fixed and immunostained for 2c18, GGA3, COP I (β'-
COP), AP-2 (α-adaptin) and EEA1. In all cases the appearance of these markers was unaffected compared to mock-transfected control cells. Bar represents 10 μm.
